

Handwritten Reflection Questions

1. Explain the different between authentication and authorization.

Ans:- Authentication is the process of verifying a user's identity using a username and password. Authorization is the process of deciding what resources or actions an authenticated user is allowed to access.

2. Why should password never be stored in plain text?

Answer: Password should never be stored in plain text because if the database is compromised, anyone can read the password. Storing hashed passwords helps protect user accounts from unauthorized access.

3. What is the purpose of password hashing?

Answer:- Password hashing converts a password into a fixed-length encrypted value called a hash. It protects the original password because the actual password is not stored, making it difficult for attacker to recover it.

4. How does duplicate login prevention improve security?

Answers: Duplicate login prevention allow only one active session for each user. It prevents unauthorized users from logging into the same account simultaneously and helps protect user account from misuse.

5. Suggest two additional security improvements for your application.

Answer:-

1. Add Two-factor authentication (2FA) to provide an extra layer of security during login.
2. Encrypt all communication between the client and server using SSL/TLS to protect data from being intercepted.
